

1. How to execute your program (3%)

A. 準備 (如下面截圖) :

- 將檔案全部弄到一個資料夾裡面 (server.cpp, agent.c, client.cpp, Makefile, tmp.mpg)
- 輸入 Command line: make
- 接著先跑一次 server 執行檔，讓 server 的資料夾: server_f 出現
./server local local 8887 8888 8889
- 把要播放的影片放到 server_f 的資料夾裡面

Step a.

Step b.

Step c.

Step d.

```

cnlab@cnlab-VirtualBox:~/cnhw3_final$ ls
agent.c client.cpp Makefile server.cpp shw_player.cpp tmp.mpg
cnlab@cnlab-VirtualBox:~/cnhw3_final$ make
g++ -std=c++11 server.cpp -o server `pkg-config --cflags --libs opencv` -pthread
server.cpp: In function 'int main(int, char**)':
server.cpp:406:29: warning: ISO C++ forbids converting a string constant to 'char*' [-Wwrite-strings]
    setIP(ip[1], "local"); //agent IP
                          ^
g++ client.cpp -o client `pkg-config --cflags --libs opencv` -pthread
client.cpp: In function 'int main(int, char**)':
client.cpp:312:29: warning: deprecated conversion from string constant to 'char*' [-Wwrite-strings]
    setIP(ip[1], "local"); //agent IP
                          ^
g++ agent.c -o agent `pkg-config --cflags --libs opencv` -pthread
agent.c: In function 'int main(int, char**)':
agent.c:72:29: warning: deprecated conversion from string constant to 'char*' [-Wwrite-strings]
    setIP(ip[1], "local");
                          ^
make: *** No rule to make target 'shw', needed by 'all'. Stop.
cnlab@cnlab-VirtualBox:~/cnhw3_final$ ./server local local 8887 8888 8889
playing: tmp.mpg
cnlab@cnlab-VirtualBox:~/cnhw3_final$ ls
agent agent.c client client.cpp Makefile server server.cpp server_f shw_player.cpp tmp.mpg
cnlab@cnlab-VirtualBox:~/cnhw3_final$ mv tmp.mpg server_f/
cnlab@cnlab-VirtualBox:~/cnhw3_final$ ls
agent agent.c client client.cpp Makefile server server.cpp server_f shw_player.cpp
cnlab@cnlab-VirtualBox:~/cnhw3_final$

```

B. 播放影片 :

- 先下 agent 的 command line，如下圖：

./agent local local 8887 8888 8889 0.1 // (0.1 是 lost rate)

```

cnlab@cnlab-VirtualBox:~/cnhw3_final$ ./agent local local 8887 8888 8889 0.1
可以開始測囉^Q^
sender info: ip = 127.0.0.1 port = 8887 and receiver info: ip = 127.0.0.1 port = 8889
agent info: ip = 127.0.0.1 port = 8888
get data #1
fwd data #1, loss rate = 0.0000

```

- 再下 client 的 command line (這裡有兩步驟要輸入!)，如下圖：

b-1 ./client local local 8887 8888 8889

b-2 play tmp.mpg // (tmp.mpg 是 filename)，截圖中是 plplay 是突然當掉了

```

cnlab@cnlab-VirtualBox:~/cnhw3_final$ ./client local local 8887 8888 8889
Giving instruction: play <filename>
plplay tmp.mpg
recv data #1
send ack #1
recv data #2
send ack #2

```

- 最後下 server 的 command line，如下圖：

./server local local 8887 8888 8889

```

cnlab@cnlab-VirtualBox:~/cnhw3_final$ ./server local local 8887 8888 8889
playing: tmp.mpg
Finded out the file, file name: tmp.mpg
send data #1, winSize = 1
recv ack #1

```

2. Explain your program structure (3% * 3)

(including 3 flow charts for sender, agent and receiver)

如下三張 flow charts，順序為：server -> agent -> receiver
